DATE MAILED: 07/13/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	09/719,721	YOSHIMURA ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	Susy N Tsang-Foster	1745	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 6/23/2004.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 2-7,9,11,16,19,20,27 and 28 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 2-7,9,11,16,19,20,27 and 28 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

***DETAILED ACTION***

***Response to Amendment***

1. This Office Action is responsive to the amendment filed on 6/23/2004. Claims 5, 7, 11, 27 and 28 have been amended. Claims 1, 8, 10, 12-15, 17, 18, and 21-26 have been cancelled. Previous art rejections based on Mukohyama et al. (US Pat. No. 5,798,188) are withdrawn in view of applicant's amendment to the claims. Claims 2-7, 9, 11, 16, 19, 20, 27, and 28 are pending and are rejected for reasons given below.

***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 2-7, 9, 11, 16, 19, 20, 27, and 28 are rejected under 35 U.S.C. 102(e) as being anticipated by Yoshimura et al. (US 6,291,094 B1).

The applied reference has a common inventor with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C.

Art Unit: 1745

102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Yoshimura et al. disclose a gas separator in the form of a bipolar plate for supplying and discharging fuel and an oxidizing agent in a fuel cell stack (col. 4, lines 48-61). The gas separator comprises two base metal plates 65 and 66 having predetermined corrugations (rugged shapes) formed by mechanically pressing thin stainless steel plates in step S100 (see Figures 4-11 and col. 6, line 6 to col. 16, line 35 of the reference, specifically col. 6, lines 15-17) and that in step 130, the base sheets 65 and 66 are joined face to face to complete separator 64 by employing an adhesive such as an electrically conductive paste which is a member (the electrically conductive adhesive) located in a space defined between the two plates and bonding the two plates together (col. 7, lines 9-14). The two base metal plates can also be made of aluminum (col. 8, lines 29-45). The electrically conductive paste is also inherently thermally conductive to some degree because an electrical conductor is not a thermal insulator. As seen in Figure 3, the fuel cell is constructed as a laminate of plural layers including electrolyte layers and electrode layers and the gas separator being adapted to form one of the plural layers. The corrugations in each plate are adapted to define at least part of a flow path of reactant gases (fluids) passing inside the fuel cell (col. 4, lines 24-36).

*It is noted that in claim 5 drawn to a gas separator, the limitation "wherein the fluid includes one of a hydrogen containing gaseous fuel, an oxygen containing oxidizing gas, and a cooling fluid for cooling down the inside of the fuel cell" is not given patentable weight because these fluids do not structurally limit the gas separator. Nevertheless, the fluid can be reactant gas fuels such as hydrogen and oxygen as stated in the paragraph above.*

*In Figure 5, both plates of the gas separator have a single coat layer as well as multiple coat layers. The word "comprising" in the preamble of claim 27 is open-ended and the gas separator can have more than a single coat layer. The word "comprising" in the preamble of claim 28 is open-ended and does not preclude a second step of forming a second coat layer after a single coat layer is formed on at least one of the two plates.*

*Nevertheless, Figure 6 shows in examples (b) and (c) gas separators that are not coated with the second coating layer of thermal expansion graphite coating such that the gas separators have only the first coating layer of either tin or nickel as shown in Figure 6 and as discussed in col. 10, lines 3-30 of the reference. In Figure 7, a fuel cell uses only a gas separator coated with a single tin layer and not with a second layer of thermal expansion graphite (col. 10, lines 31-45).*

4. Claims 2-5, 7, and 27 are rejected under 35 U.S.C. 102(e) as being anticipated by Cisar et al. (US 6,426,161 B1).

Art Unit: 1745

Cisar et al disclose a gas separator for fuel cell stack, the gas separator comprising two plates (the nickel coated layers), each of the two plates defining rugged shape on one face thereof, each of the two plates (nickel layers) further being bonded to one another through a member (the aluminum coupon) located in the space defined between the two plates and bonding the two plates together (see Figure 2, col. 1, line 65 to col. 2, line 4; col. 4, lines 15-61; column 5, line 60 to col. 6, line 67). The two plates (nickel plated layers) are further coated with a single layer of gold (col. 6, lines 65-67). The member made of aluminum is electrically and thermally conductive.

It is noted that in claim 5 drawn to a gas separator, the limitation "wherein the fluid includes one of a hydrogen containing gaseous fuel, an oxygen containing oxidizing gas, and a cooling fluid for cooling down the inside of the fuel cell" is not given patentable weight because these fluids do not structurally limit the gas separator. Nevertheless, the reference discloses that the gas separators are positioned between adjacent electrochemical cells.

### *Claim Rejections - 35 USC § 103*

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Cisar et al. (US 6,426,161 B1) in view of Walsh (US 6,096,450).

Cisar et al. disclose all the limitations of claim 5 except that a cooling fluid for cooling down the inside of the fuel cells is introduced as a fluid passing through one of the flow path defined by the rugged shapes on one surface of the gas separator. Cisar et al. disclose that the gas separator is a bipolar plate for supplying and discharging fuel and an oxidizing agent (see col. 2, lines 16-30).

Walsh teaches that a fluid flow plate for a fuel cell may be bipolar, monopolar, combined monopolar such as an anode cooler or cathode cooler, or a cooling plate and that flow channels of the fluid flow plate can carry reactant gases, as well as liquid and the function of the fluid flow plate is a matter of design choice for a fuel cell system (col. 5, lines 35-45 and col. 9, lines 64-67 and col. 10, lines 1-16).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to use the gas separator plate of Cisar et al. as a cathode or anode cooling plate having cooling fluid for cooling down the inside of the fuel cells because cooling of a fuel cell stack is necessary for proper temperature maintenance of a fuel cell stack during normal operation and gas separator plates (flow field plates) in the fuel cell art are adaptable for a variety of uses such as a bipolar, monopolar, combined monopolar such as an anode cooler or cathode cooler, or a cooling plate depending on the requirements of a fuel cell system.

7. Claims 2-5, 7, and 27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wilkinson et al. (US 5,521,018) in view of Adlhart (US Pat. No. 4,175,165).

Wilkinson et al. disclose a gas separator for a fuel cell wherein two plates of graphite foil are laminated with a metal foil layer interposed between the two plates of graphite foil (see

Art Unit: 1745

abstract; Figures 5a, 5b, 7a and 7b; col. 5, lines 29-35). The lamination bonds the two plates of graphite foil and the metal foil layer with one another. Thus, the metal foil is located in a space between the two graphite foils and bonds the two graphite foils to one another. Wilkinson et al. also disclose that graphite foils comprise an embossed surface (rugged shapes) (col. 6, lines 37-56). Wilkinson et al. also disclose that other suitable electrically conductive material sufficiently soft so as to permit embossing can be used as the two outer layers of the separator such as corrosion resistant metals such as niobium and somewhat corrosive resistant metals such as copper (col. 10, lines 24-39). The gas separator may be used as a flow field plate for fuel or oxidant or coolant (col. 11, lines 15-39 and col. 12, lines 10-34).

Wilkinson et al. do not disclose at least one of the plates of the gas separator has a single coat layer.

Adlhart teach providing a single coat layer of a wetting agent to the surfaces of the gas separator in order to render the grooves (rugged shapes) hydrophilic which remove water from the fuel cell produced during the operation of the fuel cell to prevent fuel cell flooding (col. 6, lines 3-22).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to provide a single coat layer of a wetting agent to the surfaces of the gas separator of Wilkinson et al. in order to render the rugged shapes plates hydrophilic which would remove water from the fuel cell produced during the operation of the fuel cell to prevent fuel cell flooding (col. 6, lines 3-22).

Art Unit: 1745

8. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wilkinson et al. (US 5,521,018) in view of Adlhart (US Pat. No. 4,175,165) as applied to claim 4 above, and further in view of Cisar et al. (US 6,146,780).

Wilkinson et al. in combination with Adlhart teach all the limitations of claim 6 except that the two plates are composed of stainless steel.

Wilkinson et al. also teaches that the two plates are suitably electrically conductive material sufficiently soft so as to permit embossing can be used such as corrosion resistant metals such as niobium and somewhat corrosive resistant metals such as copper (col. 10, lines 24-39).

Cisar et al. teach that bipolar separator plates are typically made from a variety of metals such as stainless steel (col. 1, lines 15-20).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to have the two plates of the separator of Wilkinson et al to be made of stainless steel because stainless steel is a corrosion resistant metal for a fuel cell system.

9. Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Wilkinson et al. (US 5,521,018) in view of Adlhart (US Pat. No. 4,175,165) as applied to claim 4 above, and further in view of Wilson et al. (US 6,037,072).

Wilkinson et al. in combination with Adlhart teach all the limitations of claim 6 except that the two plates are composed of aluminum.

Art Unit: 1745

Wilson teaches a bipolar separator plate made of aluminum that adequately withdraws heat from a fuel cell (col. 2, lines 39-46).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to have the two plates of the separator of Wilkinson et al to be made of aluminum because aluminum is lightweight and has sufficient thermal conductivity to withdraw heat away from the fuel cell.

### *Response to Arguments*

10. Applicant's arguments with respect to claims 2-7, 9, 11, 16, 19, 20, 27, and 28 have been considered but are moot in view of the new ground(s) of rejection.

### *Conclusion*

11. Any inquiry concerning this communication or earlier communications should be directed to examiner Susy Tsang-Foster, Ph.D. whose telephone number is (571) 272-1293. The examiner can normally be reached on Monday through Friday from 9:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Ryan can be reached at (571) 272-1292.

The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished
